PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/607,167

Applicant(s)

LEE, HYONG-KYUN

Examiner

Charles E. Anya

Art Unit

2194

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3/MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 9/04/07.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-22 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3 and 12-21 is/are rejected.
- 7) ☒ Claim(s) 4-11 and 22 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. Claims 1-22 are pending in this application.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. **Claim 3 is rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Pat. No. 6,223,134 B1 to Rust et al.**

4. As to claim 3, Rust teaches a method for commonly controlling device drivers, comprising the steps of: arranging a device independent access hierarchy between an application hierarchy and a device driver hierarchy (figure 5 (Class Drivers 304) Col. 13 Ln. 19 – 67); defining functions available in a corresponding device driver among functions of a function block in a function table (Col. 6 Ln. 34 – 51, IVI engine 306 Col. 16 Ln. 28 – 49, "...array of function names..." Col. 23 Ln. 29 – 42); when a device is initialized, allowing said device independent access hierarchy to generate a device handler identifier based on a standardized data format for said device and transmit the generated device handler identifier to the application hierarchy of a higher order ("...returns a handle..." Col. 20 Ln. 35 – 46, "...handle...returned..." Col. 23 Ln. 12 – 21,

"...returns a handle..." Col. 24 Ln. 22 – 29); and allowing the higher-order application hierarchy to call a predetermined device using the device handler identifier ("...this handle..." Col. 23 Ln. 12 – 28, "...use this handle..." Col. 24 Ln. 22 – 29), and allowing said device independent access hierarchy to identify a function of the corresponding device driver from the function table using the device handler identifier ("...pointer..." Col. 16 Ln. 28 – 49, "...this handle..." Col. 23 Ln. 12 – 28, Col. 24 Ln. 1 – 11) and call the function of the corresponding device driver ("...this handle..." Col. 23 Ln. 12 – 28, Col. 24 Ln. 22 – 29).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. **Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S.**

Pat. No. 6,505,258 B1 to Sakarda et al. in view of U.S. Pat. No. 6,697,884 B1

Katsch.

7. As to claim 1, Sakarda teaches a method for commonly controlling device drivers, comprising the steps of: arranging a device independent access hierarchy figures 3/4 File System Driver 405/Bridge Device Driver 415/Type Specific Driver 420)

between an application hierarchy ("...application program..." Col. 9 Ln. 46 – 56, "Application programs..." Col. 10 Ln. 65 – 67) and a device driver hierarchy (figure 4 Device Specific Driver 425) and applying a standardized rule of said device independent access hierarchy to said application hierarchy and said device driver hierarchy and allowing said application hierarchy to access the device driver hierarchy through the standardized rule of said device independent access hierarchy ("...file system..." Col. 9 Ln. 48 – 56, Type Specific Driver (TSD) 420 Col. 11 Ln. 27 – 29, Bridge Device Driver 415); when device is initialized, allowing said device independent access hierarchy to generate a device handler identifier having a standardized common data format for said device ("...identifies the peripheral device, writes the identity..." Col. 4 Ln. 62 – 66, "...parameter information..." Col. 12 Ln. 43 – 67); and allowing said device application hierarchy and said device driver hierarchy to access said the device driver hierarchy and said application hierarchy through the standardized rule of said device independent access hierarchy, respectively ("...permit communication..." Col. 4 Ln. 62 – 67, Col. 5 Ln. 23 – 27, "...send the request..." Col. 9 Ln. 46 – 56, "...communicate..." Col. 10 Ln. 65 – 67).

Sakarda is silent with reference to transmitting the generated device handler identifier to the application hierarchy of a higher order.

Katsch teaches transmitting the generated device handler identifier to the application hierarchy of a higher order ("...the host obtains configuration information..." Col. 2 Ln. 16 – 28, "...transmit data in response..." Col. 5 Ln. 6 – 8, Ln. 337 – 42, "...reply..." Col. 6 Ln. 20 – 30, Ln. 45 – 67).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify system of Sakarda with the teaching of Katsch because the teaching of Katsch would improve the system of Sakarda by providing a discovery procedure that starts by a host device sending a first command to all peripheral devices connected to the serial communication bus to determine if the configuration of any of the peripheral devices has changed (Katsch Col. 2 Ln. 7 – 10).

8. Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Pub. No. 2002/0170039 A1 to Kovacevic in view of U.S. Pub. No. 2003/0037180 A1 to Madineni et al.

9. As to claim 12, Kovacevic teaches a method, comprising: requesting loss of signal state information state information having a standardized common format by an application to a device independent access hierarchy ("...user control or status read-back..." page 1 paragraph 0015, "...generate... commands..." page 2 paragraphs 0017-0019); converting the request from said application into a first device local format and requesting a first device driver to provide state information to said independent access hierarchy ("...convert the commands to generic commands..." page 2 paragraph 0017/0019, "...translate commands..." (Steps 710-740) page 5 paragraphs 0050-0052).

Kovacevic does not explicitly teach responding to the request for state information having the first device local format and responding to said application by

said device independent access hierarchy for loss of signal state information based on the standardized common format.

Madineni teaches responding to the request for state information having the first device local format ("...only send s single, low-level message..." page 3 paragraph 0027) and responding to said application by said device independent access hierarchy for loss of signal state information based on the standardized common format ("...may also notify any interested application programs..." page 3 paragraph 0027, page 4 paragraph 0036/0037, page 5 paragraph 0039).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Kovacevic with the teaching of Madineni because the teaching of Madineni would improve the system of Kovacevic by providing technique for transparently responding to control/status request from a requesting application (Madineni page 4 paragraph 0036).

10. Claims 1,2 and 12-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Pat. No. 6,223,134 B1 to Rust et al. in view of U.S. Pat. No. 6,993,772 B2 to Pike et al.

11. As to claim 1, Rust teaches a method for commonly controlling device drivers, comprising the steps of: arranging a device independent access hierarchy between an application hierarchy and a device driver hierarchy (figure 5 (Class Drivers 304) Col. 13 Ln. 19 – 67) and applying a standardized rule of said device independent access

hierarchy to said application hierarchy and said device driver hierarchy (IVI Engine 306 Col. 16 Ln. 28 – 49); when a device is initialized, allowing said device independent access hierarchy to generate a device handler identifier having a standard common data format for said device and transmitting the generated device handler identifier having the standardized common data format to the application hierarchy of a higher order (“...returns a handle...” Col. 20 Ln. 35 – 46, “...handle...returned...” Col. 23 Ln. 12 – 21, “...returns a handle...” Col. 24 Ln. 22 – 29) and allowing said application hierarchy to access the device driver hierarchy through the standardized rule of said device independent access hierarchy (Col. 6 Ln. 34 – 51, Class Drivers 304 Col. 16 Ln. 28 – 67).

Rust is silent with reference to allowing said device driver hierarchy to access said application hierarchy through the standardized rule of said device independent access hierarchy.

Pike teaches allowing said device driver hierarchy to access said application hierarchy through the standardized rule of said device independent access hierarchy (Instrument Engine 102 “...sent and read to and from...” Col. 8 Ln. 3 – 14).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify system of Rust with the teaching of Pike because the teaching of Pike would improve the system of Rust by allowing communication between a user application and device driver such that a response could be returned to the user application.

12. As to claim 2, Pike teaches the method as set forth in claim 1, with said step of allowing said application hierarchy and said device driver hierarchy to access, further comprising the steps of: allowing said application hierarchy to transmit control commands having the on a standardized common data format for a corresponding device driver to said device independent access hierarchy, and allowing said device independent access hierarchy to convert the control commands into other control commands having a local format and transmit the converted control commands to said device driver; and allowing said device driver to give a response to the converted control commands having the local format to said device independent access hierarchy, and allowing the device independent access hierarchy to convert the response from said device driver into a response having the standardized common data format and transmit the response based on the standardized common data format to said application hierarchy (“...translate(s)...” Col. 7 Ln. 25 – 55, Instrument Engine 102 (“...formats... sent and read to and from...” Col. 8 Ln. 3 – 14).

13. As to claim 12, Rust teaches a method, comprising: requesting loss of signal (“...check instrument status...” state information having a standardized common format by an application to a device independent access hierarchy (figure 8A (Step 472) Col. 24 Ln. 32 – 37); the device independent access hierarchy allows the request from said application to provided in a first device local format (“...only required to have knowledge of the class driver 304...” Col. 15 Ln. 24 – 45) and requesting a first device driver to provide the loss of signal state information to said device independent access hierarchy

(figure 8A (step 478) Col. 24 Ln. 43 – 45); responding to the request for loss of signal state information having the first device local format (figure 8B (Step 487) Col. 23 – 27); responding to said application by said device independent access hierarchy for loss of signal state information having the standardized common format (Check Status Callback Col. 36 Ln. 46 – 49, figure 25B (Step 928) Col. 40 Ln. 15 - 20).

Rust does not explicitly teach converting the request from said application into a first device local format.

Pike teaches converting the request from said application into a first device local format (“...translate(s)...” Col. 7 Ln. 25 – 55, Instrument Engine 102 (“...formats...sent and read to and from...” Col. 8 Ln. 3 – 14).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system of Rust with the teaching of Pike because the teaching of Pike would improve the system of Rust by providing a powerful, concise mechanism that allows users to easily and quickly communicate details of different hardware interfaces having a distinct application program interface or driver modules (Pike Col. 3 Ln. 31 – 35).

14. As to claim 13, Rust teaches the method of claim 12, with said step of converting the request from said application further comprising of converting the request into a second device local format and requesting a second device driver to provide the loss of signal state information to said device independent access hierarchy having the second device local format when a first device is converted to a second device and said first

device driver is changed to said second device driver (Abstract (“...interchangeable instrument drivers), “...interchangeability...” Col. 6 Ln. 18 – 28, “...substitute other instruments...” Col. 7 Ln. 42 – 50, “...replace...” Col. 8 Ln. 22 – 28, Col. 15 Ln. 3 - 6).

15. As to claim 14, Rust teaches the method of claim 13, further comprising of converting control commands having the standardized common format to control commands provided to the device drivers accommodating a change of said application to a second application without changing the control commands provided to the device drivers (Abstract “...interchangeable instrument drivers...”).

16. As to claim 15, Rust teaches the method of claim 14, further comprised of providing a mutual interface between said application and said first and second device drivers by the device independent access hierarchy (Col. 13 Ln. 19 – 44); reading material from a device driver control block and accessing the first and second device drivers using predetermined functions (figure 5, Col. 16 Ln. 28 – 56, Col. 20 Ln. 1 – 46).

17. As to claim 16, Rust teaches the method of claim 15, further comprising of said device independent access hierarchy using device handler identifiers having the standardized data format, said device handler identifiers corresponding to respective devices (“...handle...” Col. 20 Ln. 38 – 46, “...handle...” Col. 23 Ln. 12 – 21).

18. As to claim 17, Rust teaches the method of claim 16, further comprising: providing the device handler identifiers to said application from said device independent access hierarchy during an initialization of the corresponding device; and storing, by said application, the device handler identifiers and calling a corresponding device using a corresponding device handler identifier (“...handle...” Col. 20 Ln. 38 – 46, “...handle...” Col. 23 Ln. 12 – 21).

19. As to claim 18, Rust teaches the method of claim 17, further comprising of said device independent access hierarchy determining according to said device handler identifier whether a certain device handler should be called and calling the certain device handler according to the determination (“...handle...” Col. 20 Ln. 38 – 46, “...handle...” Col. 23 Ln. 12 – 21).

20. As to claim 19, Rust the method of claim 18, with the device independent access hierarchy using certain pointers and function pointers in performing the standardized common format in the device independent access hierarchy (Col. 16 Ln. 22 – 49, Col. 20 Ln. 52 – 67, Col. 21 Ln. 17 – 30).

21. As to claim 20, Rust teaches the method of claim 19, further comprised of when said application is calling a function of a function block to be used, said device independent access hierarchy identifies the existence of a corresponding function from a function table and uses a device handler identifier to inform the initialization of the

device driver accommodating said application to access a device driver using said device handler identifier ("...handle..." Col. 20 Ln. 38 – 46, "...handle..." Col. 23 Ln. 12 – 21).

22. As to claim 21, Rust teaches the method of claim 20, further comprised of not varying the device handler identifier value for the device when said first device driver is changed to said second device driver ("...handle..." Col. 20 Ln. 38 – 46, "...handle..." Col. 23 Ln. 12 – 21).

Allowable Subject Matter

Claims 6-11 are allowed.

Claims 4-5 and 22 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Response to Arguments

Applicant's arguments with respect to claims 1-3 and 12-21 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
